In this scenario, we aim to monitor and debug the behaviour of the web server by capturing and interpreting common HTTP status codes in response to client requests. For instance, when a client accesses a valid route and receives a "200 OK" status code, we will log a success message. Conversely, if the server returns a "404 Not Found" status code, we'll log a message indicating that the requested resource couldn't be located. This approach aids in understanding and troubleshooting the server's responses to client interactions.
